Speaker: Elena Francisco, BSDH, RDHAP

Topic: Caries Management by Risk Assessment: Practical Patient Application

Course Description:

The Caries Management by Risk Assessment tool is used to assess the level of risk for caries development in dental patients based on a set of clinical, environmental, and general health factors. As a professional who works directly with patients, you can play a vital role in identifying some of these risk factors and making a preventive care program for the patient and avoid the progression of costly and devastating dental disease. This course will discuss the patient protocol and the different caries risk assessment forms available. The group will perform a CAMBRA assessment on each other and together we can discuss the products and protocol that would be appropriate in the various situations.
